

# mesvision<sup>®</sup> Promotes Retinal Imaging Awareness

Visit [MESVision.com](http://MESVision.com) for more information

**Retinal Imaging** takes a digital picture of the back of your eye. It shows the retina (where light and images hit), the optic disk (a spot on the retina that holds the optic nerve, which sends information to the brain), and blood vessels. This helps your optometrist or ophthalmologist find certain diseases and check the health of your eyes.

**Retinal Imaging can help detect and provide a closer look at many diseases including:**

- Diabetes & Diabetic Retinopathy
- Macular Degeneration
- Hypertension & High Cholesterol
- Retinal Detachment
- Cancer
- Glaucoma

Early detection and treatment can prevent up to **95%** of vision loss.

Due to late detection, many will require costly treatment from Diabetic Retinopathy.

**Remember to get your annual eye exam!**

While Retinal Imaging is easy and convenient,  
Dilation remains the standard of care.  
Both enhance the ability to diagnose ocular disease.
